An electropermanent magnet or EPM is a type of permanent magnet in which the external magnetic field can be switched on or off by a pulse of electric current in a wire winding around part of the magnet. The magnet consists of two sections, one of "hard" magnetic material and one of "soft" material. The direction of magnetization in the latter piece can be switched by a pulse of current in a wire winding about the former. When the magnetically soft and hard materials have opposing magnetizations,

However, a version of the magnetic-pole approach is used by professional magneticians to design permanent magnets. [citation needed] In this approach, the divergence of the magnetization $\nabla \cdot \mathbf{M}$ inside a magnet and the surface normal component $\mathbf{M} \cdot \mathbf{n}$ are treated as a distribution of magnetic monopoles. This is a mathematical convenience and does not imply that there are actually monopoles in the magnet.
