Dfig Control Using Differential Flatness

The differential flatness property shows that the design of a DFIG controller is possible using feed-forward control terms which are complemented by suitable error feedback terms. The design of the DFIG controller consists of two stages: (i) in the outer-loop the controller enables convergence of the stator's magnetic flux and of the rotor's angular velocity to the associated reference setpoint.

Abstract: The paper studies differential flatness properties and an input-output linearization procedure for doubly fed induction generators (DFIGs). By defining flat outputs which are associated with the rotor's turn angle and the magnetic flux of the stator, an equivalent DFIG

description in the Brunovksy (canonical) form is obtained.

Dfig Control Using Differential Flatness Theory And

Flatness in systems theory is a system property that extends the notion of controllability from linear systems to nonlinear dynamical systems. A system that has the flatness property is called a flat system. Flat systems have a (fictitious) flat output, which can be used to explicitly express all states and inputs in terms of the flat output and a finite number of its derivatives.

Release of DFIG during disturbances can cause the production of electricity will be disrupted. By applying the proper control design, the quality of electricity supply during a disturbance can be corrected. In this research, the optimal design of PI controller in the rotor side converter (RSC) with DFIG wind turbine using the Differential Evolutionary Algorithm (DE) is proposed to improve the DFIG performance during disturbance.
