Boiler Drum Level Transmitter Calibration

With the drum level transmitter properly calibrated, the midpoint of the actual readout range, typically -15 to 15 in., is zero, or mid-scale. This generally corresponds to the desired setpoint for the drum level controller. However, in some applications the setpoint may be less than zero and depends on your experience with a particular boiler.

Boiler Drum Level Transmitter Calibration - Technical Note

Boiler Drum Level Transmitter Calibration. Steam Drum Level is both a critical and difficult measurement to make. Control of the water level in the drum must be precise. A water level that is too high can result in water carryover into the steam piping. A level that is too low can expose the generating tubes (down comers), preventing the water in the drum from cooling the furnace tubes, possibly damaging them.
