Colloidal Carriers for Controlled Drug Delivery and ...

Colloidal carriers (particles, emulsions) for intravenous administration are a promising approach to achieve controlled release and site-specific delivery of drugs. The success of the systems will depend on their ability to maintain in blood circulation (controlled release system) or to reach target cells (e.g., bone marrow, blood cells).

Colloidal Carriers for Controlled Drug Delivery and ...

Colloidal drug approaches are based on colloidal drug carriers in which microscopically dispersed drug particles are suspended in a suspension form (Kreuter, 2001). The most common colloidal drug carriers are nanoparticles, micelles, liposomes, emulsions, and dendrimers (Lu et al., 2014).

CDDS are essentially required for effective transportation of loaded drug to the target site. Colloidal drug carriers such as liposomes and nanoparticles are able to modify the distribution of an associated substance. They can therefore be used to improve the therapeutic index of drugs by increasing their efficacy and/or reducing their toxicity. 7

Abstract Biopolymers represent an interesting alternative to synthetic polymers in order to be used as structured carriers for controlled release and encapsulation applications. In particular, the ability of these carriers to entrap both hydrophilic and hydrophobic drugs may be very promising for many applications.
