Lung Cancer Detection Using Image

The proposed lung cancer detection system is mainly divided into two parts. In the first part, we are doing preprocessing before feeding the images into 3D CNNs. We then detected the nodule candidate that is used to train by 3D CNNs to ultimately classify the CT scans as positive or negative for lung cancer to achieve the result.

Furthermore, the image contrast is enhanced by using adaptive histogram equalization. The preprocessed image with improved quality is subject to four algorithms. The practical results are verified for 20 sample images of the lung using MATLAB, and it was observed that the GCPSO has the highest accuracy of 95.89%. 1.

Lung Cancer Detection Using Image Processing Techniques

Lung cancer is a most common disease nowadays, so to get rid of it we have made a detection system. In this paper, an active spline model is used to segment the X-ray images of lung cancer. The system formed acquired medical images of lung X-ray. First, in preprocessing median filter is used for noise detection.
