Types of simple connections. Simple connections are nominally pinned

connections that are assumed to transmit end shear only and to have negligible resistance to rotation. Therefore do not transfer significant moments at the ultimate limit state. This definition underlies the design of multi-storey braced frames in the UK designed as 'simple construction', in which the beams are designed as ...

There is a discrepancy between the actual behavior and the analysis of steel structure is large, therefore the connections are complex to analyze and design. When the structural member fails in case of overloading then there is a general practice to prefer the individual member rather than the connections, therefore this kind of practice affects many structural members.

Pin Connection – is a joint that does not resist a moment and in the structural

computer model allows the joint to rotate eliminating the moment in a structural member. Pin connections are common in the design of trusses. Plate Girder – A typically large beam capable of supporting large loads built-up by welding various plates together.
