What is Dynamic Cone Penetrometer(DCP)? [PDF]

Dynamic Cone Penetrometer (DCP) which is used to determine the strength of subgrade and base layers. It is used by Mn/DOT and Mn/ROAD to conduct pavement research because it is easy to transport and inexpensive to operate. The DCP and its uses are fully illustrated and described in this User Guide to the Dynamic Cone Penetrometer.

User Guide to the Dynamic Cone Penetrometer

The initial reading on the dynamic cone penetrometer is recorded. Then, the dynamic cone penetrometer is kept with the cone resting vertically on the ground where the test is to be carried out. Now, the cone is driven into the soil by the freefall of hammer of 750 mm each time. Then the number of blow of every 10mm penetration is recorded.

The cone penetration or cone penetrometer test is a method used to determine the geotechnical engineering properties of soils and delineating soil stratigraphy. It was initially developed in the 1950s at the Dutch Laboratory for Soil Mechanics in Delft to investigate soft soils. Based on this history it has also been called the "Dutch cone test". Today, the CPT is one of the most used and accepted soil methods for soil investigation worldwide. The test method consists of pushing an instrumented

Cone penetration test - Wikipedia

Dynamic Cone Penetration Testing DCPT, on the other hand, uses mechanical impact to force the cone-tip into the soil, and requires only a simple and inexpensive hand-held device. It can be performed by two people, making it ideal for use in highway engineering and other types of construction or engineering that require frequent or rapid soil inspection in widely separated areas.

The Dynamic Cone Penetration Test For Soil Resistance ...

The Dynamic Cone Penetration Test provides a measure of a material's in-situ resistance to penetration. The test is performed by driving a metal cone into the ground by repeated striking it with a 17.6 lb (8 Kg)weight dropped from a distance of 2.26 feet (575 mm).

Dynamic Cone Penetration Test - Pavement Interactive

The Dynamic Cone Penetrometer is used for the rapid, in situ measurement of structural properties of existing road pavement constructed with unbound materials. It incorporates an 8 kg weight dropping through a height of 575 mm and 60° cone having a diameter of 20 mm. with the standard DCP measurements can be made down to a depth of approximately 850 mm or when extension shafts are used to a recommended maximum depth of 2 m.

Description The original Dynamic Cone Penetrometer (DCP) was developed in 1959 by the late Professor George F. Sowers. The DCP uses a 15 lb (6.8 kg) steel mass falling 20 in (50.8 cm) that strikes the anvil to cause penetration of a 1.5 in (3.8 cm) diameter cone (45° vertex angle) that has been seated in the bottom of a hand augered hole.
