Unlike conductive and convective forms of heat transfer, thermal radiation can be concentrated in a tiny spot by using reflecting mirrors, which concentrating solar power takes advantage of. Instead of mirrors, Fresnel lenses can also be used to concentrate radiant energy. (In principle, any kind of lens can be used, but only the Fresnel lens design is practical for very large lenses.)

Radiation: It is the final method of heat transfer. Different from conduction and convection, radiation does not need medium or particles to transfer heat. As it can be understood from the name, it is a type of electromagnetic wave and shows the properties of waves like having speed of light and traveling in a straight line.

Plants and soil absorb and emit radiation and increase the temperature in the greenhouse. Plants grow well in the increased temperature of the greenhouse. Vacuum flasks is designed to keep liquids hot by minimizing heat losses in four possible ways conduction, convection, radiation, and evaporation.

Examples of Radiation Heat Transfer in Everyday Life

In the current analysis, the effect of thermal radiation, heat generation, and induced magnetic field on hydromagnetic free convection flow of couple stress fluid in an isoflux- isothermal vertical channel has been investigated. The governing equations are solved analytically, and closed form solutions are obtained.
