Cell Biology Of Cancer

A cancer cell is a cell that grows out of control. Unlike normal cells, cancer cells ignore signals to stop dividing, to specialize, or to die and be shed. Growing in an uncontrollable manner and unable to recognize its own natural boundary, the cancer cells may spread to areas of the body where they do not belong.

Cell Biology of Cancer | SEER Training

Carcinomas, the most common types of cancer, arise from the cells that cover external and internal body surfaces. Lung, breast, and colon are the most frequent cancers of this type in the United States. Sarcomas are cancers arising from cells found in the supporting tissues of the body such as bone, cartilage, fat, connective tissue, and muscle.

Abstract. NAD is a vital molecule in all organisms. It is a key component of both energy and signal transduction--processes that undergo crucial changes in cancer cells. NAD (+)-dependent signalling pathways are many and varied, and they regulate fundamental events such as transcription,

DNA repair, cell cycle progression, apoptosis and metabolism. Many of these processes have been linked to cancer development.

The NAD metabolome--a key determinant of cancer cell biology

Collection: Cancer Biology We have assembled a collection of recent papers that highlights the many facets of cancer biology, including a mix of cancer subtypes and approaches. The papers cover topics ranging from the initiation of tumor formation to cancer progression and metastasis, as well as therapeutic approaches.
