Membrane computing is a branch of natural computing which abstracts computing models from the architecture and the functioning of living cells, as well as from the organization of cells in tissues, organs (brain included) or other higher order structures such as colonies of cells (e.g., of bacteria). Membrane computing was initiated in 1998 Păun Gh.

Membrane Computing - Scholarpedia

Membrane computing is a branch of natural computing inspired from the architecture and the functioning of biological cells. The obtained computing models are distributed parallel devices, called P systems, processing

multisets of objects in the compartments defined by hierarchical or more general arrangements of membranes.

A quick introduction to membrane computing - ScienceDirect

Membrane computing – in general, multiset processing by means of rewriting-like rules – is a technique complementary to systems of differential equations, in many cases as relevant as differential equations, in most cases much easier to use, and in some cases the unique technique which can be used; this last situation is met, for instance, when we deal with small populations of reactants, such that a discrete model is the only one adequate

Journal of Membrane Computing | Home

Membrane computing (or MC) is an area within computer science that seeks to discover new computational models from the study of biological cells, particularly of the cellular membranes. It is a sub-task of creating a cellular model . Membrane computing deals with distributed and parallel computing models, processing multisets of symbol objects in a localized manner.
