Reasoning. Reasoning in ontologies and knowledge bases is one of the reasons why a specification needs to be formal one. By reasoning we mean deriving facts that are not expressed in ontology or in knowledge base explicitly. All of the formalisms that were discussed in this section were created with the outlook of automatic processing, but due their properties such as decidability or computational complexity or even due to the level of formality it is not always possible.

Description. Knowledge representation is a significant branch of Artificial intelligence. It studies the formalization of knowledge and its processing within machines. Techniques of automated reasoning allow a computer system to draw conclusions from knowledge represented in a machine-interpretable form. Semantic networks provide a means to abstract from natural language, representing the knowledge that is captured in the text in a form more suitable for computation. The lack of semantics ...

The ultimate goal of Semantic Web is to make the machine to understand the Internet data. To enable the encoding of semantics with the data, well-known technologies are RDF and OWL. These technologies formally represent the meaning involved in information. For example, ontology can describe concepts, relationships between things, and categories of things. These embedded semantics with the data offer significant advantages such as reasoning over data and dealing with heterogeneous data sources. T
