Circuit Description. Circuit Graph. This is a 50% Duty Cycle Astable Multivibrator using the 555 timer IC. An approximately 50% duty cycle is achieved by discharging the timing capacitor through a voltage divider from Vcc to the discharge pin. This allows the discharging period to be equal to the charging period by finding the proper combination of Ra and Rb.

The basic astable 555 timer cannot produce a 50 percent duty cycle. However, unless a circuit is affected by the difference between 50 percent and 50.34 percent at 1 Hertz in the example then a 555 should work just fine in a circuit. Below are three calculated values of the duty cycle for the values shown.
 $R1 = 10K / C1 = 1\mu F$

An approximately 50% duty cycle is

achieved by modifying the control voltage to 1/2 the supply voltage. This allows the periods of low and high states to become equal. The 10 kOhms resistor (Rctl) from the control pin of the 555 to ground modifies the reference voltages of the two comparators inside the timer.

555 Timer 50% Duty Cycle - Multisim Live

A 555 can be used to generate clock pulses in a wide range of frequencies with enough output power to drive several ICs. The oscillation frequency is calculated with the following formula: The same circuit can be used to control DC loads such as LEDs, lamps and DC motors. The idea is to use this circuit as a PWM signal generator.

It turns out that there are many uses for two (or more) 555 timers in a single electronic circuit — useful enough that you can get two 555 timers in a single chip, called the 556 dual-timer chip. The 556 dual-timer chip comes in a 14-pin DIP package. The two 555 timers share a common supply and ground pin.

May 20, 2020 - A pot can be used to control the position of the servo by using the following circuit. It produces a positive pulse between about 0.9 milliseconds and 2.1 milliseconds. The off period between pulses is about 40 milliseconds. This can be shortened by

reducing the value of the 3M3 resistor.
