Effect Of Temperature Relative Humidity

The everyday response of relative humidity to temperature can be easily explained. On a summer morning, the temperature might be 15 °C (59 °F) and the relative humidity 100 percent. The vapour pressure would be 17 mb (0.02 standard atmosphere) and the mixing ratio about 11 parts per thousand (11 grams of water per kilogram of air by weight).

Climate - Relation between temperature and humidity ...

The dried virus on smooth surfaces retained its viability for over 5 days at temperatures of 22-25°C and relative humidity of 40-50%, that is, typical air-conditioned environments. However, virus viability was rapidly lost (>3 log(10)) at higher temperatures and higher relative humidity (e.g., 38°C, and relative humidity of >95%).

The Effects of Temperature and Relative Humidity on the ...

If you decrease the temperature, then the relative humidity will increase. If the temperature goes down enough without the water vapor amount changing, then you will eventually reach 100 percent relative humidity. At this point, water will start to condense and form dew. The temperature at which the dew begins to form is known as the dew point.

The rate of evaporation is actually driven by the relative humidity to a greater degree than by temperature. But, in fact, the two are inter-related. As the temperature of air is increased, it can absorb more liquid and, therefore, the relative humidity is decreased. Lower relative humidity promotes faster drying.

Inactivation was more rapid at 20°C than at 4°C at all humidity levels. Both viruses were inactivated more rapidly at 40°C than at 20°C. The relationship between inactivation and RH was not monotonic, and there was greater survival or a greater protective effect at low RH (20%) and high RH (80%) than at moderate RH (50%).

It may be that at 40°C AT effects are the predominant effects that cause viral inactivation and that RH levels play a lesser role than they do at lower ATs.
