Answer: The optimal solution is obtained by maximizing the payoff function  $\pi(x,y) = -4x + 2y$ . The first-order maximization condition is  $\pi_x = 0$  implying that  $x = 8$  is the optimal solution. For  $y = 1$  the solution is  $y = 1/8$  and for  $x = 4$  it is  $y = 1/2$ .  $\pi(8,1/8) = 1/8$ . Show that in general, smaller people should drink less than larger people.

A solution to a game describes the optimal decisions of the players, who may have similar, opposed, or mixed interests, and the outcomes that may result from these decisions. Although game theory can be and has been used to analyze parlour games, its applications are much broader.

It is a well developed discipline that has applications in areas such as business, politics and economics. Game theory is often based on highly constrained situations with clear rules and agents who act logically. As such, it doesn't always apply to real world situations where rules, behavior, risk and opportunity tend to be dynamic and ambiguous. Nevertheless, game theory offers some useful models that can be applied to real world problems and decisions.

Games of perfect information have been studied in combinatorial game theory, which has developed novel representations, e.g. surreal numbers, as well as combinatorial and algebraic (and sometimes non-constructive) proof methods to solve games of certain types, including "loopy" games that may result in infinitely long sequences of moves. These methods address games with higher combinatorial complexity than those usually considered in traditional (or "economic") game theory.
