Shooting Method In Solving Boundary

In numerical analysis, the shooting method is a method for solving a boundary value problem by reducing it to the system of an initial value problem. Roughly speaking, we 'shoot' out trajectories in different directions until we find a trajectory that has the desired boundary value.

Shooting method - Wikipedia

The shooting method uses the same methods that were used in solving initial value problems. This is

done by assuming initial values that would have been given if the ordinary differential equation were an initial value problem. The boundary value obtained is then compared with the actual boundary value.

SHOOTING METHOD IN SOLVING BOUNDARY VALUE PROBLEM

You can use the shooting method to solve the boundary value problem in Excel. Discussion. The shooting method is a well-known iterative method for solving boundary value problems. Consider this example: This is a second-order equation subject to two boundary conditions, or a standard two-point boundary value problem.

Shooting method A method for solving initial and boundary value problems for ordinary differential equations. It consists of introducing control variables (parameters) and subsequently determining them from the system of equations, where this choice of parameters has a decisive influence on the acceleration of the solution of the system.

Shooting method - Encyclopedia of Mathematics

There are several approaches to solving this type of problem. The first method that we will examine is called the shooting method. It treats the two-point boundary value problem as an initial value problem (IVP), in which x plays the role of the time variable, with a being the "initial time" and b being the "final time".
