Management

As sickle cell trait is usually asymptomatic, management consists mainly of providing appropriate advice. Explain to the person with sickle cell traits and/or their family/carers that: They should very rarely have symptoms. However, they are at risk of a vaso-occlusive episode if they become oxygen deprived.

sickle cell disease management, including the use of red blood cell transfusion in the context of acute or regular top-ups and red cell exchanges. However, the importance of issuing extended-phenotyped blood must be emphasised, particularly as these patients often present acutely to general medical services. Alloimmunisation occurs in around 30% of

Management of sickle cell disease | The BMJ

Sickle cell disease is a group of disorders that affects hemoglobin, the molecule in red blood cells that delivers oxygen to cells throughout the body. People with this disease have atypical hemoglobin molecules called hemoglobin S, which can distort red blood cells into a sickle, or crescent, shape. Signs and symptoms of sickle cell disease usually begin in early childhood.

Sickle cell disease: managing the condition - GOV.UK

Sickle cell trait occurs when a person inherits a gene for normal haemoglobin (Hb A) from one parent and a gene for sickle cell haemoglobin from their other parent; their genotype is Hb AS. These people rarely have symptoms; however, they have a 50% chance of passing the sickle cell gene to their child. If both parents are carriers, there is a 1 in 4 chance that their child will be born with sickle cell disease.

Sickle cell disease - Wikipedia

Stem cell or bone marrow transplants

Stem cell or bone marrow transplants are the only cure for sickle cell disease, but they're not done very

often because of the significant risks involved. Stem cells are special cells produced by bone marrow, a spongy tissue found in the centre of some bones. They can turn into different types of blood cells.

Sickle cell disease:

Scenario:

Management - chronic ...

Sickle cell disease (SCD) is an autosomal recessive genetic condition that describes a group of haemoglobin disorders caused by genetic variants in the HBB gene, resulting in the production of sickle haemoglobin (HbS) rather than normal haemoglobin A (HbA).

Sickle cell disease - Genomics Education Programme

Sickle cell disease (SCD) is a life threatening autosomal recessive genetic disorder resulting from

inheritance of abnormal genes from both parents. Normal red blood cells (RBCs) are biconcave disc shaped and move smoothly through the blood capillaries. The RBCs are produced in bone marrow and average life of normal RBCs is about 120 days.

Sickle-cell disease — Vikaspedia

Treatments for sickle cell include antibiotics, pain management and blood transfusions. A new drug treatment, hydroxyurea, which is an anti-tumor drug, appears to stimulate the production of fetal hemoglobin, a type of hemoglobin usually found only in newborns. Fetal hemoglobin helps prevent the "sickling" of red blood cells.

About Sickle Cell Disease - Genome.gov

Haemoglobin disorders are genetic blood diseases due to inheritance of mutant haemoglobin genes from both, generally healthy, parents. Over 300 000 babies with severe haemoglobin disorders are born each year. The health burden of haemoglobin disorders can be effectively reduced through management and prevention programmes.
