This study performs a series of non-linear static pushover analyses using a modal

load case on three steel moment-resisting frames (MRFs) of 4-storeys, 8-storeys and 16-storeys. The frames are studied with three different types of connections; fully-fixed moment connections, RBS connections and RWS connections, in order to compare the differences in capacity curves, inter-storey drifts and plastic hinge formation.

Nonlinear static pushover analysis gives a better view on the performance of the structures during seismic events. The seismic performance of a multi-story steel frame building is designed according to the provisions of IS 800 2007. Steel structures are more elastic than RCC structures but they show lateral deflection than RCC building.

A typical six-story steel

frame building is designed for various types of eccentric bracings as per the IS 800- 2007. D, K, and V are the different types of eccentric bracings considered for the present study. Performance of each frame is studied through nonlinear static analysis. Repository Staff Only: item control page

Results of a pushover analysis of GFRP pultruded frames aimed at the evaluation of their overall ductility are presented. It is assumed that the dissipation capacity of the frame structures is concentrated in joints due to their nonlinear behavior induced by progressive damage, while a brittle-elastic behavior is assumed for frame members. A two-storey one-bay GFRP pultruded frame is considered for a case study in which the column-base and beam-column joints are modeled with nonlinear

The static pushover analyses were performed using SINTEF's USFOS program (SINTEF, 1991, 1993, 1994). USFOS is a very capable advanced state-of-the-art analysis program designed to perform collapse analysis of steel offshore structures. Its solution procedure accounts for both geometric and material nonlinearities. USFOS incrementally increases
