Spectral Fatigue Analysis

Spectral fatigue analysis. In a spectral fatigue analysis wave loads are computed for deterministic waves of different periods and heights and from different directions. Any wave theory may be used, i.e. Airy, Stokes 5th, Stream Function, etc. An analysis of the structure subjected to these waves is then performed. This may be a static or a dynamic analysis.

SPECTRAL-BASED FATIGUE ANALYSIS FOR VESSELS

In general, spectral based fatigue analysis may be performed by carrying out computation of wave induced loads in frequency domain for the loading conditions for specific vessel type, application of loads to the structural model to generate the stress Response Amplitude Operators (RAOs) and then obtaining the response spectrum at each location of interest by considering the environment.

Guidelines on Spectral Fatigue Analysis of Ship Structures

Spectral-based Fatigue Analysis is a complex and numerically intensive technique. As such, there is more than one variant of the method that can be validly applied in a particular case. ABS does not wish to preclude the use of any valid variant of a Spectral-based Fatigue Analysis method by “over specifying” the elements of an approach.
