The Effective Fragment Molecular Orbital

Recently, we developed the effective fragment molecular orbital (EFMO) method, which builds upon the fragment molecular orbital (FMO) method –, and combines it with effective fragment potentials (EFP) –. EFMO is different from EFP, FMO and FMO/EFP, in several ways.

Effective fragment molecular orbital (EFMO) method combines some features of the effective fragment potentials (EFP) and FMO. A detailed perspective on the fragment-based method development can be found in a recent review.

The effective fragment molecular orbital (EFMO) method is a merger of the effective fragment potential (EFP) method and the fragment molecular orbital (FMO) method and combines the general applicability of the FMO method (for example, to flexible biomolecules) with the speed of the EFP method.

We extend the effective fragment molecular orbital method (EFMO) into treating fragments connected by covalent bonds. The accuracy of EFMO is compared to FMO and conventional ab initio electronic structure methods for polypeptides including proteins. Errors in energy for RHF and MP2 are within 2 kcal/mol for neutral polypeptides and 6 kcal/mol for charged polypeptides similar to FMO but ...

In this paper we have shown that the effective fragment molecular orbital (EFMO) method , can be used to efficiently map out enzymatic reaction paths provided the geometry of a large part of the enzyme and solvent is frozen. In EFMO one defines an active region associated with the active site, and the cost of a geometry optimization is then essentially the cost of running quantum-mechanical calculations of the active domain.

The frozen domain effective fragment molecular orbital method is extended to allow for the treatment of a single fragment at the MP2 level of theory. The approach is applied to the conversion of chorismate to prephenate by Chorismate Mutase, where the substrate is treated at the MP2 level of

theory while the rest of the system is treated at the RHF level.

To predict functional liquid’s properties, it is mandatory to apply ab initio MD (AIMD) calculations (e.g., Car–Parrinello MD, CPMD; fragment molecular orbital based MD, FMO-MD), in which intermolecular interaction is evaluated on a quantum mechanical level. However, because the computational costs of AIMD are much higher than those of classical MDs, it had been difficult to perform AIMD simulations to predict novel functions of compressed liquid materials, including supercritical fluids.

The development of a combined Quantum Monte Carlo (QMC) - Effective Fragment Molecular Orbital (EFMO) method is described. The combined QMC-EFMO method inherits the advantages of both methods: the high accuracy of the QMC computational results and the favourable computational scaling due to the EFMO fragmentation of large systems.

In 2016, Sepehr et al. evaluated the effective interaction parameters of DPD for Nafion, based on ab initio molecular orbital (MO) calculations. 75 Although ab initio evaluations of χ parameters for DPD are desirable, its applicability could be limited due to the enlarged computational costs when

In this work we extend the effective fragment molecular orbital (EFMO) method [20,21] into the frozen domain (FD) formalism [18], originally developed for the fragment molecular orbital (FMO) method [22–25]. For FMO, there is also the partial energy gradient method [26]. EFMO is based on dividing a large molecular system into

Fragmentation: Toward Accurate Calculations on Complex Molecular Systems introduces the reader to the broad array of fragmentation and embedding methods that are currently available or under development to facilitate accurate calculations on large, complex systems such as proteins, polymers, liquids and nanoparticles. These methods work by subdividing a system into subunits, called fragments or subsystems or domains.
