Lecture 18: Discrete-time processing of continuous-time signals. 18 Discrete-Time Processing of. Continuous-Time. Signals. One very important application of the concept of sampling is its role in pro- cessing continuous-time signals using discrete-time systems. Specifically, the continuous-time signal, which either is assumed to be bandlimited or is forced to be bandlimited by first processing with an anti-aliasing filter, is sam- pled and the samples are converted to a discrete-time ...

And after appropriate discreet-time processing, that sequence is converted back to a continuous-time signal through an operation which I label as a discrete to continuous time converter. Now, in the lecture last time, we carried out some analysis which related for us the spectra in the first step of this operation.

When t denotes the time, we also refer to such a signal as a continuous-time signal. - Discrete signal: $n \in \mathbb{Z} \rightarrow x[n] \in \mathbb{R}$ or $\mathbb{C}$ When index n represents sequential values of time, we refer to such a signal as discrete-time. - Digital signal: $n \in \mathbb{Z} \rightarrow x[n] \in A$ where $A = \{a_1, \dots, a_L\}$ represents a finite set of L signal levels. - Multi-channel signal: $x(t) = (x_1(t), \dots, x_N(t))$

Discrete-time signals can be created by an analysis process where we take periodic measurements of a physical phenomenon, think of the floods of the Nile if you want. Or in a synthesis process where we use say a computer program to generate data point that simulate a physical phenomenon that we want to reproduce, we will see an example very soon.
