To the extent that biofilms are physiologically or structurally heterogeneous, with phages exploiting particularly relatively newly divided biofilm-surface bacteria, then even effective phage predation of natural biofilms could result in less than complete overall biofilm clearance. Phage tendencies toward only partial exploitation of even single-species biofilms could be consistent with observations that chronic bacterial infections in the clinic can require more aggressive or extensive ...

Bacteriophages and Biofilms. "Bacteriophages (phages) are the viruses of bacteria and biofilms represent a frequent niche for bacteria, where they are embedded in extensive extracellular polymeric substances (EPS) and can be structured into complex microcolonies. As a consequence of the resulting spatial structure and heterogeneity, phage-bacterial interactions within biofilms can be more complicated than those between phages and planktonic bacteria.

"Bacteriophages, or phages for short, are viruses that infect and kill bacteria. Their potential as antibacterial agents was realised shortly after their discovery more than 100 years ago and for about 20 years phage preparations had been produced on large scale by pharmaceutical companies in Europe and elsewhere.

In addition to discussing the ecology of phage-biofilm interactions, considered as well are related issues of phage-mediated biocontrol or phage therapy of biofilm-associated bacteria. Provided specifically is a synopsis of the phage-treatment-of-biofilms literature and then tips on how to optimize, in terms of phage application alone, the use of viruses of bacteria as anti-biofilm agents.

Here, we discuss a concept of using bacteriophages to biocontrol oral biofilms. 1.1. Biology of bacteriophages. Bacteriophages, or short phages, are viruses that predate prokaryotes. In this review, we focus on tailed, double-stranded DNA phages that make up 96% of all phage isolates. Their taxonomy is as follows.

Robust evidence is somewhat lacking for biofilm susceptibility to bacteriophages in nature, contrasting often substantial laboratory biofilm vulnerability to phages. To help bridge this divide, I review a two-part scenario for 'heterogeneous' phage interaction even with phage-permissive single-species biofilms.

### **Bacteriophage exploitation of bacterial biofilms: phage ...**

Phages are actively involved in biofilm formation, in two different ways: as promoting or degrading agents. Phages can be equipped with matrix-degrading enzymes and effectively infect biofilm-embedded cells. In this meaning, phages are a natural and helpful weapon against microbial biofilms.

### **Viruses | Special Issue : Bacteriophages and Biofilms**

Although relatively large numbers of phage are found in many of the environments in which biofilms are formed, and despite the increasing volume of studies on microbial biofilms, relatively few have examined the effects of bacteriophage on the bacterial components of these mixed microbial communities.

The bacteriophages were co-administered with ciprofloxacin in order to determine whether the bacteriophages would

demonstrate synergistic or antagonistic behaviour to the antibiotic in vitro. Results suggest a potential relationship between the bacteriophage plaque size and biofilm inhibition, where those producing smaller plaques appear to be more effective at reducing bacterial biofilm ...

**Antibiofilm potential of purified environmental ...**

Bacteriophages (often known simply as phages) are naturally occurring viruses that infect bacteria. As such, they are unaffected by antibiotic resistance and (unlike many antibiotics) are able to target bacteria within biofilms [ 1 ].
