Abstract. Enhancement of the surface wettability and surface free energy of thermoplastic materials is an effective way of improving their adhesion and consequently the adhesive joint strength. A nanosecond pulsed Nd:YAG laser was selected in this work to provide energetic treatment of PEEK surfaces, in order to investigate its effectiveness in increasing the performance of lap shear adhesive joints.

Recently, it has been demonstrated that laser surface modification enable to enhance the adhesion of subsequent coating layers , , which suggests the potential of decomposing the precursor films and modifying the ceramic surfaces by laser modification simultaneously. Thus, it underlines the necessity of basic researches such as studying the effects of processing parameters on adhesion and the optimization of processing parameters.

Excimer lasers have been employed to modify the surfaces of a range of polymers to enhance adhesion. Considerable increases in joint strength were achieved as a result of laser treatment. Many lap shear joints, exposed to hot/wet environments, provided high retention of joint strength and durability.
