Tensegrity, tensional integrity or floating compression is a structural principle based on a system of isolated components under compression inside a network of continuous tension, and arranged in such a way that the compressed members (usually bars or struts) do not touch each other while the prestressed tensioned members (usually cables or tendons) delineate the system spatially.

Tensegrity Structures: What They Are and What They Can Be

'Tensegrity describes a closed structural system composed of a set of three or more elongate compression struts within a network of tension tendons, the combined parts (are) mutually supportive in such a way that the struts do not touch one another, but press outwardly against nodal points in the tension network to form a firm, triangulated, prestressed, tension and

compression unit.’

1 ABSTRACT Tensegrity is relatively a new principle (50 years) old based on the use of isolated components in compression inside a net of continues tension member. In such a way that the compressed member (usually bars or struts) do not touch each other and they pre-stressed tensioned members (usually cables or tendons) delineate the system specially and in a self-equilibrated state.

The different understandings of tensegrity systems that occurred in the design process, as “discrete pneumatic structures,” enable to propose a general definition of tensegrity systems. The tensegrity grids are considered as reliable, solid, adaptive, and quite rigid discrete pneumatic structures. The chapter introduces smart structures with its basic ideas, active control, and structures of the future and Tensegrity as a structural principle.

In the 1950s, Buckminster (Bucky) Fuller – the architect who invented the geodesic dome – took controversial ownership of this structural system and created the term “tensegrity” to describe “self-tensioning structures composed of rigid structures and cables, with forces of traction and compression, which form an integrated whole”.

Tensegrity, or tensile integrity, describes a system of isolated, compressed components within a network of chords that are under continuous tension. In a pure tensegrity structure, these components do not touch but experience compression nonetheless. It’s hard to believe that strings could be made to support compressive loads.
