Solved Problems in Classical Mechanics suggested that a student first attempt a question with the solution covered, and only consult the solution for help where necessary. Both analytical and numerical (computer) techniques are used, as appropriate, in obtaining and analyzing solutions.

Solved Problems in Classical Mechanics

The velocity
 vector components
 are: $v_y = dy/dt$
 $v_x = dx/dt$ The vector

components of the vector that connects the particle to the point on the x-axis are: $V_y = y'(t)$, $V_x = x'(t)$. For these to be the same, then $v_y v_x = V_y V_x \Rightarrow dy/dx = y'(t) x'(t) / (x'(t) f'(t)) = dy/dx$. This cannot be integrated with $f(t)$ being arbitrary.

For example, consider a falling body. $F = ma$ gives $-mg = ma$, which can be written as $-g = \ddot{y}$, where a dot denotes a time derivative. This is a rather simple differential equation, and you can quickly guess that $y(t) = -gt^2/2$ is a solution. Or, more generally with the constants of

integration thrown in, $y(t) = y_0 + v_0 t - gt^2/2$.

Classical mechanics is

Here is a simple exercise to get you started: Find the general solution of the first order equation $df/dt = f$ for an unknown function $f(t)$. [There are several ways to do this. One is to rewrite the equation as $df/f = dt$ and then integrate both sides.] How many arbitrary constants does the general solution contain?
