Interspinous distraction is a new type of lumbar surgery for spinal stenosis. This technique involves making a small incision above your spine and placing a metal device, known as a spacer, between 2 vertebrae, so that they can't move onto the underlying nerve.

Lumbar decompression

surgery - How it's performed - NHS

The sternum is the elongated bony structure that anchors the anterior thoracic cage. It consists of three parts: the manubrium, body, and xiphoid process. The manubrium is the wider, superior portion of the sternum. The top of the manubrium has a shallow, U-shaped border called the jugular (suprasternal) notch. This can be easily felt at the anterior base of the neck, between the medial ends of the clavicles.

7.4 The Thoracic Cage - Anatomy and Physiology

The size of a cage was determined based on the disc height. The involved titanium cages (Titanium

O.I.C.®, Stryker, NJ, USA) were of various sizes (width: 11 mm, angulation: 0°, 4°, 8°, height: 9-13 mm, length: 20, 25 mm) and they were rectangular in shape and radiopaque.

Posterior Lumbar Interbody Fusion Using a Unilateral ...

The spine is made up of 24 individual bones, called vertebrae, which are stacked on top of each other to form the spinal column. In between each vertebra are protective, circular pads of tissue called discs, which cushion the vertebrae during activities such as walking and running. The spinal canal runs through the centre of the spinal column.
