Anne Marie Helmenstine, Ph.D. Updated  
January 04, 2019. A balanced chemical  
equation gives the number and type of  
atoms participating in a reaction, the  
reactants, products, and direction of the  
reaction. Balancing an unbalanced  
equation is mostly a matter of making  
certain mass and charge are balanced  
on the reactants and products side of  
the reaction arrow.

When balancing equations, remember  
chemical reactions must satisfy  
conservation of mass. Check your work  
to make certain you have the same  
number and type of atoms on the  
reactants side as on the products side. A  
coefficient (number in front of a  
chemical) is multiplied by all the atoms  
in that chemical.

Balancing chemical equations involves the addition of stoichiometric coefficients to the reactants and products. This is important because a chemical equation must obey the law of conservation of mass and the law of constant proportions , i.e. the same number of atoms of each element must

exist on the reactant side and the product side of the equation.
