Q1: What do you mean by Electromagnetic induction ? Ans: The finding that electric current can produce magnetic fields led to the idea that magnetic fields could produce electric currents. The production of emfs and currents by the changing magnetic field through a conducting loop is called magnetic induction.

As the magnet moved through the coil, the field lines cut through the turns on the coil. This induces an emf in the coil. When the magnet enters the coil, the field lines cut through the turns, inducing an EMF. More generally, whenever the magnetic field passing through a loop of wire changes, an EMF is induced.

Electromagnetic Induction | CIE IGCSE Physics Revision Notes

In 1831, Michael Faraday carried out numerous experiments in his attempt to prove that electricity could be generated from magnetism. Within the course of a few weeks, the great experimentalist not only had clearly demonstrated this phenomenon, now known as electromagnetic induction, but also had developed a good conception of the processes involved. One of the

experiments performed by Faraday in that important year featured a permanent magnet and a galvanometer connected to a coil of wire ...

1. Induction Experiments(Faraday / Henry) - If the magnetic flux through a circuit changes, an emf and a current are induced. - A time-varying magnetic field can act as source of electric field. - A time-varying electric field can act as source of magnetic field. Maxwell - An induced current (and emf) is generated when: (a) we move a magnet around a coil, (b) move a second coil toward/away another coil, (c) change the current in the second coil by opening/closing a switch.

Chapter 29 - Electromagnetic Induction

When the red coil is vertical there are no magnetic flux lines passing through the coil (the area is 0). But when the coil is horizontal as shown then the magnetic flux is a maximum because the area is a maximum (flux = BA)} Induced emf = $\frac{\Delta \Phi}{\Delta t}$ [final flux - initial flux time taken.] $E = (200)[0.01 - 0.02]$

Answer. Answer: (b) small but not zero. Question 4. In the expression $e = - \frac{d\Phi}{dt}$, the -ve sign signifies: (a) The induced emf is produced only when magnetic flux decreases. (b) The induced emf opposes the change in the magnetic flux. (c) The induced emf is opposite to the direction of the flux.

Other than that, quantitatively the phenomena of electromagnetic induction is given by the Faraday's law as, $\mathcal{E} = -\frac{d\phi_B}{dt}$ where ϕ_B is the magnetic flux and $\mathcal{E}$ is the emf generated. The generation of emf is due to the generation of the electric field. In terms of Maxwell's equations, the phenomena can be described accurately as,

The answer is that the source of the work is an electric field that is induced in the wires. 13.6: Eddy Currents A motional emf is induced when a conductor moves in a magnetic field or when a magnetic field moves relative to a conductor. If motional emf can cause a current in the conductor, we refer to that current as an eddy current.
