The goal of cellular respiration and metabolism in animals and plants is, ultimately, the conversion of one type of energy source to another. Presumably, the original energy source comes in a form that cannot be immediately used to support cellular activities. For humans, our external energy sources are the foods we eat.

Cell Respiration: Introduction: Cellular Energy Sources ...

Cellular respiration is the process through which cells convert fuel into energy and nutrients. To create ATP and other forms of energy that they can use to power their life functions, cells require fuel and an electron acceptor which drives the chemical process of turning energy from that fuel into a useable form.

Cellular respiration is a common process that is carried out by many organisms to make and release energy. It is basically a process through which the cells covert glucose and oxygen to carbon dioxide and water, and hence release energy for ATP. ATP stands for adenosine triphosphate and is the free energy that is used by cells.

Stages of Cellular Respiration
Cellular respiration is the process cells use to extract the energy in organic compounds, particularly glucose.
Cellular respiration occurs in three major stages
Stage 1:glucose is converted to pyruvateproducing a small amount of ATP and NADH
Stage 2:Aerobic respiration occurs: this is when oxygen is present, pyruvate and NADH make more ATP.
Stage 3: In an electron transfer chain, continuing reactions create a large amount of ATP from ...
