Balkwill, J. (2017) Performance Vehicle Dynamics Slip angle. To fully understand tyre dynamics, the first thing you need to get your head round is slip angle. This is defined as the angle (degrees) formed between the actual direction of travel of the wheel and the 'pointing' direction of the wheel (perpendicular to the axis of rotation).

To distinguish between the effects of tyre force lags, tyre non-linearities, and combined tyre—vehicle non-linearities,

an increasingly complex approach is adopted, which involves the implementation of a linear bicycle model, a non-linear bicycle model, and a ten-degrees-of-freedom (10DOF) non-linear vehicle model. In all cases, tyre-force ...

Snow chains, or tire chains, are devices fitted to the tires of vehicles to provide maximum traction when driving through snow and ice.. Snow chains attach to the drive wheels of a vehicle or special systems deploy chains which swing under the tires automatically. Although named after steel chain, snow chains may be made of other materials and in a variety of patterns and strengths.

Snow chains - Wikipedia

A widely used semi-empirical tire model to calculate the steady-state tire force and moment characteristics for use in vehicle dynamics studies is based on the Magic Formula. The Magic Formula $y(x)$ typically produces a curve that passes through the origin $x = y = 0$, reaches a maximum, and subsequently tends to a horizontal asymptote.
