Erin Byrne, MathWorks This video shows you an example of designing a signal processing system using Simulink ®. You start off with a blank Simulink model and design a signal processing algorithm to predict whether it is going to be sunny or cloudy in order to optimize power generated from a solar energy grid.

Digital filters introduce delay in your signal. Depending on the filter characteristics, the delay can be constant over all frequencies, or it can vary with frequency. The type of delay determines the actions you have to take to compensate for it. The `grpdelay` function allows you to look at the filter delay as a

function of frequency.

If your model uses a fixed-step solver, Simulink ® uses the same step size for the entire simulation. In this case, the Signal Generator block output provides a uniformly sampled representation of the ideal waveform. If your model uses a variable-step solver, Simulink might use different step sizes during the simulation.
