Automation Of Cytogenetics

Cytogenetics is a branch of genetics associated with the study of the structure and function of the cell, especially the chromosomes. It includes routine analysis of G-banded chromosomes, other cytogenetic banding techniques, as well as molecular cytogenetics such as fluorescent in situ

hybridization (FISH) and comparative genomic hybridization. This presentation will focus on the automation process in a cytogenetic laboratory.

Automation in a Cytogenetic Laboratory : Leica Biosystems

The aim had always been to automate the cytogenetics process from the sample preparation step to the analysis, because we believe that automation is key to improving standardisation methods and to the accuracy and quality of analysis, increasing efficiency, reducing turnaround times, avoiding operator variability (a critical point in cytogenetic services) and ultimately strongly boosting the quality of our service for the benefit of the patients.

Automating the cytogenetics process

Collaborative cytogenetics automation research and development activities in Europe are now supported by the "Concerted Action in Automation of Cytogenetics" (CAACG), as one of the activities of the EC's COMAC-BME committee which supervises the coordination of research in biomedical engineering within the Medical Technology Development target (project no. 11.1.1/13).
