The energy of a heavy ion beam is directly transferred to efficient ionization of atoms and ions; the specific energy loss is high in a cylindrical volume around the particle beam axis with the energy loss dE/dx scaling as Z^2 , implying higher energy densities with the highest Z beams. High power is achieved with pulsed bunched beams from present accelerators, typical pulse

widths being around 1 ns, and most accelerators have very attractive duty cycles compared to pulsed lasers.

High-energy nuclear physics studies the behavior of nuclear matter in energy regimes typical of high-energy physics. The primary focus of this field is the study of heavy-ion collisions, as compared to lighter atoms in other particle accelerators. At sufficient collision energies, these types of collisions are theorized to produce the quark-gluon plasma. In peripheral nuclear collisions at high energies one expects to obtain information on the electromagnetic production of leptons and ...
