Cytogenetics & FISH - Hematogenix

ABSTRACT: Chronic myelogenous leukemia (CML) is a myeloproliferative disorder characterized by a translocation between chromosomes 9 and 22, forming the Philadelphia (Ph) chromosome. This and other chromosomal abnormalities can be detected with the use of cytogenetics, a branch of genetics focusing on chromosomal structure.

Cytogenetics of Chronic Myelogenous Leukemia

Complex chromosomal abnormalities were often overlooked by conventional cytogenetics but identified by FISH tests in many cases. After a median follow-up of 58 months (range 1-242 months), 11 patients died, and 3 lost contact, while the others achieved different cytogenetic/molecular responses.
