Named Entity Recognition With Character

We discuss two named-entity recognition mod-els which use characters and character n-grams either exclusively or as an important part of their data representation. The first model is a character-level HMM with minimal con-text information, and the second model is a maximum-entropy conditional markov model with substantially richer context features. Our

Named Entity Recognition with Character-Level Models

Most state-of-the-art named entity recognition (NER) systems rely on handcrafted features and on the output of other NLP tasks such as part-of-speech (POS) tagging and text chunking. In this work we propose a language-independent NER system that uses automatically learned features only. Our approach is based on the CharWNN deep neural network, which uses word-level and character-level ...
