Cancer and thrombosis: recent advances

Recent evidence suggests that antithrombin anticoagulant activity is also tightly regulated by other post-translational modifications, such as citrullination, where arginine residues are modified by the action of protein arginine deiminases (Chang et al, 2005; Ordonez et al, 2009; Tilvawala et al, 2018). Specifically, citrullination of the P1 arginine in the antithrombin reactive centre loop was found to completely ablate antithrombin ability to recognise and inhibit its protease substrates.
