Mplus Discussion>. Structural equation modeling is a statistical method that includes the estimation of models with regressions among continuous latent variables or factors. Path analysis is a special case of structural equation

modeling where all variables are observed. Mplus can estimate both structural equation models and path models for a single or multiple groups.

Mplus Discussion >> Structural Equation Modeling

By default in Mplus Version 6 and later, analyses with mean structures set the intercepts to zero in the first group and allow them to be freely estimated in the second group. This should be done when loadings are also constrained (strong factorial invariance). Newsom Psy 523/623 Structural Equation Modeling, Spring 2018 2

Mplus from Scratch

Mplus is a powerful statistical package used for the analysis of latent variables. Among the kinds of analysis it can perform are exploratory factor analysis, confirmatory factor analysis, latent class analysis, latent growth curve modeling, structural equation modeling and multilevel modeling. The program can handle a combination of categorical and continuous variables and often permits missing data.
