Generally speaking, waves are oscillations (or disturbances) of the water surface that can be observed in any water basin like rivers, lakes, seas, and oceans. For a wave to exist there must be an initial equilibrium state, which is perturbed by an initial disturbance and compensated by a restoring force.

In classical mechanics the evolution over time of a wave, for example a sound wave or a water wave, is described by a wave equation: a differential equation whose solution is a wave function, which gives you the shape of the wave at any time (subject to suitable boundary conditions).

Matter waves are a central part of the theory of quantum mechanics, being an example of wave-particle duality. All matter exhibits wave-like behavior. For example, a beam of electrons can be diffracted just like a beam of light or a water wave. In most cases, however, the

wavelength is too small to have a practical impact on day-to-day activities.
