Power has become the gating factor in many designs below 40nm on a variety of fronts, ranging from leakage current at 28nm and 20nm, and again at 7nm; dynamic power density at 16/14nm using finFETs; and at thermal effects caused by power. On top of that, there are related issues such as electromigration and electrostatic discharge.

For Power factor improvement purpose, Static capacitors are connected in parallel with those devices which work on low power factor. These static capacitors provides leading current which neutralize (totally or

approximately) the lagging inductive component of load current (i.e. leading component neutralize or eliminate the lagging component of load current) thus power factor of the load circuit is improved.
