Let's examine the transition that infants make from responding to the external world reflexively as newborns, to solving problems using mental strategies as two-year-olds. Piaget called this first stage of cognitive development sensorimotor intelligence (the sensorimotor period) because infants learn through their senses and motor

skills. He subdivided this period into six substages:

As an infant's memory develops, they are able to separate the people that they know from the people that they do not. The same cognitive advances allow

infants to respond positively to familiar people and recognize those that are not familiar. Separation anxiety also indicates cognitive advances and is universal across cultures. Due to the infant's increased cognitive skills, they are able to ask reasonable questions like "Where is my caregiver going?" "Why are they leaving?" or ...

What Is Lifespan Development? | Introduction to Psychology

Babies are not only growing physically during the first 2 years of life, but also cognitively (mentally). Every day while they interact with and learn about their environment they are creating new connections and pathways between nerve cells both within their brains, and between their brains and bodies. While physical growth and change is easily observed and measured in precise terms

such as in inches and pounds, cognitive change and development is a little harder to determine as clearly.
