In the variational functional framework ,
a gray-tone image is generally
represented by a square-integrable gray-
tone function. The basic idea is to
consider that the resulting gray-tone
image of a processing or an analysis is
the solution of a variational problem or,
in other words, that this gray-tone
function minimizes a suitable functional
operating in an appropriate gray-tone
function space.

Conditional Variational Image Deraining. Abstract: Image deraining is an important yet challenging image processing task. Though deterministic image deraining methods are developed with encouraging performance, they are infeasible to learn flexible representations for probabilistic inference and diverse predictions. Besides, rain intensity varies both in spatial locations and across color channels, making this task more difficult.

For the reconstruction step, variational methods are often adopted as it can combine salient features (such as edges) and non-critical regions into a uniform model and solve for a consistent fused image through a stable iterative process.
