A maximum is a high point and a minimum is a low point: In a smoothly changing function a maximum or minimum is always where the function flattens out (except for a saddle point). Where does it flatten out? Where the slope is zero. Where is the slope zero? The Derivative tells us! Let's dive right in with an example:

Finding Maxima and Minima using Derivatives

Historically, the term probable maximum loss (PML) has been used to describe building damageability in earthquakes, that is, the likelihood a building

will experience damage during a seismic event. Without a standard definition, inconsistencies resulted, and PML now has “a number of very different explicit and implicit definitions.”

Seismic Probable Maximum Loss - Partner Engineering and ...

Probable maximum loss (PML) is a concept commonly used in property insurance. It refers to an estimate of the maximum losses an insurer can incur if the insured property is completely destroyed. Total losses can occur if something disastrous happens to a piece of real property, like a fire razing a building to the ground.

What is Probable Maximum Loss? - Definition from ...

Probable maximum loss (PML) is a term used in the insurance industry as well as commercial real estate. Although the definition is not consistent in the insurance industry, it is generally defined as the value of the largest loss that could result from a disaster, assuming the normal functioning of passive protective features (e.g. firewalls, nonflammable materials, flood defences etc.) and proper functioning of most (perhaps not all) active suppression systems (e.g. sprinklers).
