K-means clustering is a simple unsupervised learning algorithm that is used to solve clustering problems. It follows a simple

procedure of classifying a given data set into a number of clusters, defined by the letter "k," which is fixed beforehand. The clusters are then positioned as points and all observations or data points are associated with the nearest cluster, computed, adjusted and then the process starts over using the new adjustments until a desired result is reached.

Advances In K Means Clustering A Data Mining Thinking ...

The modified version of GA has used a new adaptive position crossover technique to improve the convergence of the GA. The chapter emphasizes the significance of metaheuristic approaches in data clustering. Because of a global optimization technique, the GA has been used in k-means clustering. The

performance of clustering is dependent on the initial cluster centers and the outliers present in the dataset. k-means clustering is also stuck in a local minimum.

Adaptive Position-Based Crossover in the Genetic Algorithm ...

K-means clustering is a type of unsupervised learning, which is used when you have unlabeled data (i.e., data without defined categories or groups). The goal of this algorithm is to find groups in the data, with the number of groups represented by the variable K. The algorithm works iteratively to assign each data point to one of K groups based on the features that are provided. Data points

are clustered based on feature similarity.

Introduction to K-means Clustering - Oracle Blogs

k-means clustering is a method of vector quantization, originally from signal processing, that aims to partition n observations into k clusters in which each observation belongs to the cluster with the nearest mean (cluster centers or cluster centroid), serving as a prototype of the cluster. This results in a partitioning of the data space into Voronoi cells.

k-means clustering - Wikipedia

K-Means clustering algorithm is defined as an unsupervised learning method having an iterative process in which the

dataset are grouped into k number of predefined non-overlapping clusters or subgroups making the inner points of the cluster as similar as possible while trying to keep the clusters at distinct space. It allocates the data points to a cluster so that the sum of the squared distance between the cluster centroid and the data point is at a minimum, at this position the centroid of ...
