Performance measurements: Web performance involves measuring the actual and perceived speeds of an application, optimizing where possible, and then monitoring the performance, to ensure that what you've optimized stays optimized. This involves a number of metrics (measurable indicators that can indicate success or failure) and tools to measure those metrics, which we will discuss throughout this module.

What is web performance? - Learn web

development | MDN

Performance is a necessary pillar of web development in which every web developer should stay current on best practices. It may “profoundly affect the initial reaction of the users when they first visit your website, and can in-turn impact the subscription base of your beloved product or blog page” according to Owen Far of Hackernoon**.

In this code, `shouldComponentUpdate` is just checking if there is any change in `props.color` or `state.count`. If those values don't change, the component doesn't update. If your component got more

complex, you could use a similar pattern of doing a “shallow comparison” between all the fields of props and state to determine if the component should update.
