length scale l , we have $Re \propto l \nu /h$. In the low Re regime, which could be due to small size and/or high viscosity, hydrodynamics is governed by viscous forces. For microorganisms in water, with typical values $l \approx 110 \text{ }\mu\text{m}$ and $\nu \approx 10 \text{ mm}^2/\text{s}$, $Re \approx 10^{-4}$. Therefore, microorganisms live the “life at low Reynolds number”.

Low-Reynolds number hydrodynamics is at the heart of the ability of flagella to generate propulsion at the micrometer scale. In fact, fluid dynamic forces impact many aspects of bacteriology, ranging from the ability of cells to reorient and search their surroundings to their interactions within mechanically and chemically complex environments.

Stokes flow, also named creeping flow or creeping motion, is a type of fluid flow where advective inertial forces are small compared with viscous forces. The Reynolds number is low, i.e. $Re \ll 1$. This is a typical situation in flows where the fluid velocities are very slow, the viscosities are very large, or the length-scales of the flow are very small. Creeping flow was first studied to understand lubrication. In nature this type of flow occurs in the ...
