The aim of this book is to demystify IPMs, so they become the model of choice for populations structured by size or other continuously varying traits. The book uses real examples of increasing complexity to show how the life-cycle of the study organism naturally leads to the appropriate statistical analysis, which leads directly to the IPM itself.

The Data-Driven paradigm for computational mechanics (Kirchdoerfer, Ortiz, 2016, Kirchdoerfer, Ortiz, 2017) bypasses any modeling step, by formulating the problem directly on a given material data set, while enforcing pertinent constraints and conservation laws. More specifically, by defining a phase space of stress-strain field pairs, this approach leads to a distance minimization problem between a given material data set and the subset of field pairs that satisfy the conservation laws.

Abstract. In this work we propose a data-driven age-structured census-based SIRD-like epidemiological model capable of forecasting the spread of COVID-19 in Brazil. We model the current scenario of closed schools and universities, social distancing of people above sixty years old and voluntary home quarantine to show that it is still not enough to protect the health system by explicitly computing the demand for hospital intensive care units.
