An electric motor doesn't produce its power in perceivable pulses like a two or four-stroke engine does. Each pulse of power from a petrol engine is an opportunity for the tyre to lose traction. Once lost, that traction is hard to grab hold of again, and whichever way you fix it, anything done is killing your momentum.

An electric locomotive is a locomotive powered by electricity from overhead lines, a third rail or on-board energy storage such as a battery or a supercapacitor . Electric locomotives with on-board fueled prime movers, such as diesel engines or gas turbines, are classed as diesel-electric or gas turbine-electric and not as electric locomotives, because the electric generator/motor combination serves only as a power transmission system .
