The x-bar and R-chart are quality control charts used to monitor the mean and variation of a process based on samples taken in a given time. The control limits on both charts are used to monitor the mean and variation of the process going forward. If a point is out of the control limits, it indicates that the mean or variation of the process is out-of-control; assignable causes may be suspected at this point.

Proportional control, in engineering and process control, is a type of linear feedback control system in which a correction is applied to the controlled variable which is proportional to the difference between the desired value and the measured value. Two classic mechanical examples are the toilet bowl

float proportioning valve and the fly-ball governor. The proportional control concept is more complex than an on-off control system like a bi-metallic domestic thermostat, but simpler than a ...
