Hydrodynamic Design Of Ship Hull
Ship science links the heritage of maritime design, and the potential of modern scientific knowledge. A refined

hull shape epitomizes that link between tradition and science. A modern naval architect carefully designs the hull shape based on previous examples and the science of hydrodynamics. This article glimpses into the background of hydrodynamics by exploring the link between the science of Bernoulli's equation and the shape of ship hulls.

In summary, the simulation-based hydrodynamic design/optimization of ship hull forms generally requires the following steps: (1) define an initial hull form with a set of design parameters/variables using hull surface modeling technique, (2) simulate the flow for the given hull form using CFD tools and evaluate the objective functions in terms of the flow solutions obtained, (3) minimize the objective functions using an optimization technique and update the design variables.

A hydrofoil is a lifting surface, or foil, that operates in water. They are similar in appearance and purpose to aerofoils used by aeroplanes. Boats that use hydrofoil technology are also simply termed hydrofoils. As a hydrofoil craft

gains speed, the hydrofoils lift the boat's hull out of the water, decreasing drag and allowing greater speeds.
