The principal difference when compared to using ordinary microprocessors is the ability to make substantial changes to the datapath itself in addition to the control flow. On the other hand, the main difference from custom hardware, i.e. application-specific integr

Coarse-grained reconfigurable architectures (CGRAs) offer performance and energy efficiency close to those of ASICs and a programmability level closer to application software, offering a good trade-off between NRE and device cost. However, CGRAs have not yet been widely adopted because of a lack of mature architectures and programming tools.
