OXIDATION & REDUCTION. Aldehydes can be oxidised by mild oxidising agents to carboxylic acids, but ketones are not oxidised by these oxidising agents as a C-C would have to be broken. Aldehydes and ketones can both be reduced to alcohols (primary alcohols to aldehydes, ketones to secondary alcohols).

Title: reaction of aldehydes and ketones Introduction: An aldehyde is an organic compound containing a formyl group. This functional group, with the structure R-CHO, consists of a carbonyl center bonded to hydrogen and an R group. The group without R is called the aldehyde group or formyl group. Aldehydes differ from ketones in that the carbonyl is placed at the end of a carbon skeleton rather ...

Aldehydes and ketones undergo a variety of reactions that lead to many different products. The most common reactions are nucleophilic addition reactions, which lead to the formation of alcohols, alkenes, diols, cyanohydrins (RCH(OH)C≡N), and imines (R<sub>2</sub>C=NR), to mention a few representative examples.

### How will you distinguish between aldehyde and ketone?

Among the most useful and characteristic reactions of aldehydes and ketones is their reactivity toward strongly nucleophilic (and basic) metallo-hydride, alkyl and aryl reagents. If the carbonyl functional group is converted to an acetal these powerful reagents have no effect; thus, acetals are excellent protective groups, when these irreversible addition reactions must be prevented.

### 1st ionisation energy (down group)

The most common reaction of aldehydes and ketones is nucleophilic addition. This is usually the addition of a nucleophile and a proton across the C=O double bond. As the nucleophile attacks the carbonyl group, the carbon atom changes from sp<sup>2</sup> to sp<sup>3</sup>. The electrons of the C=O bond are pushed out onto the oxygen, generating an alkoxide anion.

### Ketones and Aldehydes - Rutgers University

Ozonolysis is a reaction method in which addition of ozone molecules or O<sub>3</sub> to an alkene compound leads to the formation of ozonide. Reduction of the ozonide compound with the help of zinc dust and water produces the smaller molecules, which in this case will be the respective aldehydes and ketones.

### Preparation of Aldehydes and Ketones: Methods, Concepts ...

Aldehydes contain their carbonyl group at the end of the carbon chain and are susceptible to oxidation while Ketones contain theirs in the middle of the carbon chain and are resistant to oxidation. Jones's Test, Tollen's Reagent and Iodoform Reaction were the three tests used to determine the reactions of aldehydes and ketones. The Chromic Anhydride test caused Aldehydes to turn blue, and Ketones orange.
